Deployment:

To deploy our product you will need to first create a folder in whichever directory you use. Then you have to download the apache2 HTTP Server onto your machine. You will need to configure the files so that the root directory is the directory you saved the folder in. You then need to download sudo apt-get install phpmyadmin so that you can connect to the database. You then need to configure apache to link with the phpmyadmin tool. After setting everything up, you need to clone the repository using "git clone https://github.com/stki9539/Calorie-Website.git" into the root directory folder for apache2. Once you clone the repository, open the internet and go to the address localhost/. This will take you to our main page and you will be able to navigate through our website.
